With version 6.0, Windows CE makes a big step into the direction that zenon developers and users have long been waiting for: with an increased address space of up to 2 GB and 32,000 simultaneous processes, it is the ideal basis for our CE specialists. 10 years of COPA-DATA experience make sure that you get the best out of the new CE 6.0.

Good experience

COPA-DATA recognized the potential of Windows CE as the first HMI/SCADA provider – and supported the operating system since version 2.0 in 1998. For zenon users this means profit today from years of experience and sophisticated technology.

zenon works perfectly with the Windows CE platform and uses all the features offered by the operating system. This way, Windows CE with zenon can work as a fully functional client or server in the network. It uses the same Editor as on all other Windows operating systems for convenient parameterizing instead of risky programming. Also it integrates perfectly with our straton soft PLC.

You can save valuable resources in engineering and maintenance tasks. To make sure you can use the full CE power, we have doubled the maximum number of variables in Windows CE 6.0, allowing up to 4096 tags.

Better overview for exact forecasts

The new power of Windows CE 6.0 enables us to include features for CE devices that engineers and zenon fans have long wishing for.

With the Archive Server and the Extended Trend Module, you can now get a fast and exact overview of their production processes in CE. A specially adapted Starter Edition of this analytic double pack is available for CE devices.

This means data archiving and meaningful trend curves are now also available for Windows CE. There is no limit, thanks to the internal integration you can easily send your archives to a PC for comprehensive analyses. Therefore, processes recorded on a Windows CE device can also be analyzed on a PC without any problem or restriction.

Telecommander for Windows CE

With zenon, you can monitor and control Windows CE applications comfortably from a distance – as you prefer. Use the Remote Desktop for direct access to the remote Windows CE device; perfect for fast and direct access from your home or a remote office. Or you want continuous remote engineering and application control? For that, we recommend the zenon Web Server Pro. It allows up to three users to fully operate the visualization at the same time.
